1 About this document

1.1 Navigation

You will find information about a specific valve throughout the document. The structure of chapters 2 to 4 is as follows:

2 Engineering	device oriented
3 Handling	process oriented
3.1 Mounting and installation	
3.2 Commissioning and maintenance	
3.3 ...	
4 Functions and control	assembly oriented
4.1 Selection of acting direction and valve characteristic	
4.2 Calibration	
4.3 ...	

1.2 Revision history

Revision	Date	Changes	Chapter	Page(s)
First edition	2011-09-11	-	-	-
Rev. 2	2014-02-03	VVF/VXF22/32/42 implemented VVF43/53..K implemented	all	-
Revision 2.1	2014-10-20	Changed VVF43/53..K	2.1.3, 2.3.3, 2.6.1-2.6.3, 2.7, 2.9, 2.11, 2.12.4-2.12.6, 3.1.2, 4.3.6, 6, 7	-
Revision 2.2	2017-03-02	Changed value in row 'Water with antifreeze'	2.8.3	39
		Corrected value to saturated steam	2.10.4	47
Revision 2.3	2023-03-24	Correction factor F_R , changed value (new 0.66, was 0.70)	2.8.3.2	40
		Correction data e.g. cold water	2.14.2	64
		VVF/VXF63.. implemented	all	-
		Liquids instead of fluids		
		SAV.. added		
Various adjustments according to current data sheets, e.g.: Direction of flow, materials, mounting position, accessories, spare parts, Stem sealing gland, module A2, differential pressure, formulas, dimensions, revision numbers.				
New address block incl. footer, even page number and layout

1.4 Before you start

1.4.1 Trademarks

The table below lists the trademarks used in this document and their legal owners. The use of trademarks is subject to international and domestic provisions of the law.

Trademarks	Legal owner
Acvatix™	Siemens AG

All product names listed in the table are registered (®) or not registered (™) trademarks of the owner listed in the table. We forgo the labeling (e.g. using the symbols ® and ™) of trademarks for the purposes of legibility based on the reference in this section.

1.4.2 Copyright

This document may be duplicated and distributed only with the express permission of Siemens, and may be passed only to authorized persons or companies with the required technical knowledge.

1.4.3 Quality assurance

The document was prepared with great care. Please make sure that you are aware of the latest document revision date.

- The contents of all documents are checked at regular intervals
- Any corrections necessary are included in subsequent versions
- Documents are automatically amended as a consequence of modifications and corrections to the products described

If you find lack of clarity while using this document, or if you have any criticisms or suggestions, please get in touch with your local contact person in the nearest Siemens branch office. For addresses of the Siemens branch offices, please visit www.siemens.com/acvatix

1.4.4 Document use / request to the reader

Before using our products, it is important that you read the documents supplied with or ordered at the same time as the products (equipment, applications, tools, etc.) carefully and in full.

We assume that persons using our products and documents are authorized and trained appropriately and have the technical knowledge required to use our products as intended.

More information on the products and applications is available:

- On the intranet (Siemens employees only) at <https://workspace.sbt.siemens.com/content/00001123/default.aspx>.
- From the Siemens branch office near you or from your system supplier
- From the Support Team at headquarters (fieldsupport-zug.ch.sbt@siemens.com) if there is no local point of contact

Siemens assumes no liability to the extent allowed under the law for any losses resulting from a failure to comply with the aforementioned points or for improper compliance of the same.

1.5 Validity of documentation

This document shall serve as a knowledge base. In addition to basic knowledge, it provides general technical information about valves used in HVAC plants.

For project engineers, electrical HVAC planners, system integrators, and service engineers, the document contains all information required for planning, engineering, correct installation, commissioning, and servicing.

2 Engineering

2.1 Product description

The large-stroke valve line consists of 2-port and 3-port valves.

2.1.1 2-port valves

Type of valve	Product number	Connections
Standard valves	VVF22.., VVF32.., VVF42..	Flanged
	VVG41..	Externally threaded
	VVI41..	Internally threaded
High-performance valves for higher medium temperatures	VVF43.., VVF53.., VVF63..	Flanged
Pressure-compensated valves	VVF42..K, VVF43..K, VVF53..K, VVF63..	Flanged

Applies only to valves of category I or II conforming to PED 97/23/EC
 - 10 Notified body number for monitoring production centers as per module A2 of PED 97/23/EC.
Applies only to valves of category II
-  QR code (Siemens in-house usage)

2.2 Use

The valves are used as control or shutoff valves in heating, ventilation and air conditioning plants for the production and distribution of heat or cooling energy, as well as in district heating plants and in steam applications.

All 3-port valves can be used as mixing valves (preferred use) or diverting valves. For use in closed or open hydraulic circuits, observe chapter "Cavitation", page 65.

2.2.1 Compatibility with medium and temperature ranges

1) Version: S = standard / H = high-performance / D = pressure-compensated / W = heat transfer oils

2) Type of connection: F = flanged / ET = externally threaded / IT = internally threaded

3) Differentiation due to saturated steam curve. For details, refer to chapter 0, page 59

4) Open circuits

5) Min. dryness at inlet: 0.98

6) Use version with tight bypass VXG41..01!

7) VVF42..K / VVF43..K / VVF53..K / VVF63.. due to the sealing material in the pressure compensation these valves cannot be used for media temperatures below -5 °C

Note

For a detailed list of the permissible types of antifreeze and brines, refer to "8.1.7 Overview of antifreeze and brines used in the trade", page 100. The notes given under "2.13 Medium quality and medium treatment", page 67 must also be observed.

- 1) Flange type: 21 / flange design: B (siehe " Flange types ", page 82)
- 2) Suitable for medium temperatures up to 150 °C
- 3) Suitable for medium temperatures up to 130 °C, up to 150 °C with horizontal mounting position
- 4) Valves with supplemental designation ..F (e.g. VVF63.25-10F) - with special flange can be ordered exclusively for France.
- 5) Valves with supplemental designation ..L (e.g. VVF63.25-10L) - with parabolic plug can be ordered for special applications (low noise).
- 6) Operate with opposite flow direction with steam
- 7) Reduced kvs value
- 8) For certain valve lines and high kvs values, the valve characteristic is optimized for maximum volumetric flow kV100.

Note

Other maximum differential and closing pressures are valid for applications with steam, for further details refer to "Applications with steam" on page 20.

Applications with steam

Valves of the product lines VVF43.. and VVF53.. and VVF63.. have to be operated with inverted flow direction for steam. This results in combination with electrohydraulic actuators of the product lines SKD.., SKB.. und SKC.. with significantly higher closing pressures Δp_s and higher maximum differential pressures Δp_{max} . In individual cases the k_{vs} value is reduced and it has to be assured from the system side, when the system is starting up that the maximum differential pressure Δp_{max} is not exceeded so that the actuator can reliably open the valve.

¹⁾ Flange type: 21; flange design: B (see "Flange types", page 82)

²⁾ Suitable for medium temperatures up to 130 °C, up to 150 °C with horizontal mounting position

³⁾ Valve characteristics for pressure compensated valves for k_{vs} value 100 m³/h from 70 % stroke, k_{vs} value 40,160 and 250 m³/h from 80 % stroke and k_{vs} value 63 m³/h from 90 % stroke is optimized for maximum volumetric flow.

Liquids and Steam

Applications with steam

Valves of the product lines VVF43..K and VVF53..K and VVF63..K are regarding flow direction optimized for liquids and steam. This results in combination with electrohydraulic actuators of the product lines SKD.., SKB.. and SKC.. with significantly higher closing pressures Δp_s and higher maximum differential pressures Δp_{max} .

In individual cases the k_{vs} value is reduced and it has to be assured from the system side, when the system is starting up that the maximum differential pressure Δp_{max} is not exceeded so that the actuator can reliably open the valve.

- 1) Auxiliary switch, potentiometer
2) Position feedback, forced control, selection of valve characteristic
3) Optional: Sequence control, selection of acting direction
4) Plus sequence control, stroke limitation, and selection of acting direction
5) Position feedback, forced control

2.3 Ordering

Example

Product number	Stock number	Description	Quantity
VVF53.15-0.16	S55208-V100	2-port valve	1
ASZ6.6	S55845-Z108	Stem heating element	1
-	4 284 8806 0	Stem sealing gland EPDM	1

Delivery

Actuator, valve and accessories are packed and supplied as separate items.

Note

Counter-flanges, bolts and gaskets must be provided on site.

2.4 Accessories

2.4.1 Electrical accessories

Product number	Stock no.	Description	Note	
ASZ6.6	S55845-Z108	Stem heating element	Required for medium temperatures < 0 °C	

Note

Valve lines V..F43/53..

When using a stem heating element and the medium temperature is below –5 °C, the stem sealing gland must be replaced. In that case, the sealing gland must be ordered also.

DN 15...50: 4 284 8806 0

Note

Fittings for drinking water applications according to DVGW, drinking water ordinance 2001, have to be purchased locally from specialized trade.

2.5 Product replacement

The valves covered by this document replace the valves of the VVF../VXF.. lines that have been produced by Siemens, Landis & Staefa and Landis & Gyr since 1974.

For most types of valves operating in the field, a one-to-one replacement is available.

This does not apply to a small number of special valves that were marketed in certain regions. If there is a need to replace such valves, please contact your Siemens branch office. In that case, it might be necessary to change the piping.

Stem coupling for SKC32../62/82.. (stock no. 4 178 5649 8)

Further use of actuators of the SKD32../60/62/82.., SKB32../60/62/82.., SQX31../61../81.., and SQX32../62../82.. lines is possible.

Actuators of the SKC32../62/82.. lines require a new stem coupling since the diameter of the new stem is only 10 mm. Stem couplings must be ordered as separate items (stock no. 4 178 5649 8).

If the valve to be replaced was driven by an actuator of the SKD31../61../81.., SKB31../61../81.. or SKC31../61../81.. lines, Siemens recommends to replace the actuator as well, the reason being the actuator's age.

The tables below list former valve types and their successors. There is also an online replacement guide "Old2New" available; for access, go to www.siemens.com/hit under "Old2New replacement guide".

2.5.1 2-port valves

2-port valves with flanged connections						Replacement

VVF52..	VVF52..A	VVF52..G	-	VVF52..M	15...40	-	-	VVF53..	15...40
VVF61..	-	-	-	-	15..150	-	-	VVF63..	15..150

¹⁾ Since the new valves use uniform stem couplings, valves driven by electrohydraulic actuators SKC.. require a new stem coupling

²⁾ Replacement valves are the same nominal size DN, but have different k_{VS} values. This must be taken into consideration when replacing a valve in the plant (stability, active stroke range)

³⁾ If differential pressures are high, VVF43..K can be used as a replacement

Note

When using valves of the V..F43.. or V..F53.. and V..F63.. lines with a stem heating element and a medium temperature of below -5 °C, the stem sealing gland must be replaced. In that case, the sealing gland must be ordered also.

DN 15...50: 4 284 8806 0

DN 65...150: 4 679 5629 0

Note

Valve line VVF45..

Valves of the VVF45.. line close with the pressure, which means that when used in combination with SKB.. or SKC.. actuators, very high closing pressures are permitted. If such closing pressures are indeed required, valves of the VVF43..K line should be used as a replacement

Note

Valve line VVF31.. from DN50

The follow-on series VVF32 supports only select k_{VS} values. For smaller k_{VS} values, it makes more sense to replace the VVF31.. valve with series VVF42..valves. The k_{VS} values for services VVF42.. must support the k_{VS} value for VVF31 valves. The valves series VVF31 and VVF42 are identical regarding face-to-face dimension, flange bolt circle and flange bolt dimensions.

2.5.2 3-port valves

3-port valves with flanged connections								Replacement	
Type					DN	Adapter	Stem coupling ¹⁾	Product number	DN
VXF21..	-	-	-	-	25...80	-	-	VXF22..	25...80

VXF41..	VXF41..4		VXF41..5		15	ALF41B15	-	VXF53..	15
					25	ALF41B25	-		25
					40	ALF41B40	-		40
VXF41.49..	VXF41.494..		VXF41.495..		50	ALF41B50	-	VXF53.50.. ²⁾	50
VXF41.50..	VXF41.504..		VXF41.505..		ALF41B50	-	VXF53.50..		
VXF41..	VXF41..4				VXF41..5		65	ALF41B65	4 178 5649 8 ³⁾
		80		ALF41B80			4 178 5649 8 ³⁾	80	
		100		ALF41B100			4 178 5649 8 ³⁾	100	
		125		ALF41B125			4 178 5649 8 ³⁾	125	
		150		ALF41B150			4 178 5649 8 ³⁾	150	
VVF61..	-	-	-	-	-	15..150	-	VVF63..	15..150

¹⁾ Since the new valves use uniform stem couplings, valves driven by electrohydraulic actuators SKC.. require a new stem coupling

²⁾ Replacement valves are the same nominal size DN, but have different k_{VS} values. This must be taken into consideration when replacing a valve in the plant (stability, active stroke range)

³⁾ ALF41B65 .. 150 include the 10 mm stem washer to connect the existing SKC with the new VXF43.. valves.

Note When using valves of the V..F43.. or V..F53.. and V..F63.. lines with a stem heating element and the medium temperature is below -5 °C, the stem sealing gland must be replaced. In that case, the sealing gland must be ordered also.

DN 15...50: 4 284 8806 0

DN 65...150: 4 679 5629 0

Notes When replacing old valves by new valves, the installation might have to be modified.

Valve lines VXF53../VXF43..
The dimension of the bypass is smaller than that of the valves of the former VXF41.. line. This means that a one-to-one replacement of the VXF41.. valves requires an ALF41B.. adapter. This adapter compensates for the difference in dimensions, thus facilitating replacement of the valve without having to modify the piping. The washer to fit the existing SKC actuator to the new valve with 10 mm stem diameter is added to the ALF41B65 to ..150.

Notes The follow-on series VXF32 supports only select k_{VS} values. For smaller k_{VS} values, it makes more sense to replace the VXF31.. valve with series VXF42.. valves. The k_{VS} values for services VXF42.. must support the k_{VS} value for VXF31 valves. The valves series VXF31 and VXF42 are identical regarding face-to-face dimension, flange bolt circle and flange bolt dimensions.

Product number	Stock number	Description	Note	
ASZ6.6	S55845-Z108	Steam heating element	Required for medium temperatures < 0 °C	
-	4 284 8806 0	Steam sealing gland	When using valves of the V..F63.. lines DN 15...50 with a stem heating element and a medium temperature below -5 °C, the stem sealing gland must be replaced. With the gland 428488060, the valve can be used with water, water with anti-freeze and brines between -25 °C and 150 °C	
-	4 679 5629 0	Steam sealing gland	When using valves of the V..F63.. lines DN 65...150 with a stem heating element and a medium temperature below -5 °C, the stem sealing gland must be replaced. With the gland 467956290, the valve can be used with water, water with anti-freeze and brines between -25 °C and 150 °C.	

Product number	Stock number	Description	Note	
ASZ6.5 Not available for order	ASZ6.5 Not available for order	Stem heating element	Required for medium temperatures < 0 °C	

Note

The ASZ6.5 stem heating element was compatible with actuators SKB..., SKC..., SKD..., and SQX... Always replace the installed stem heating element with the ASZ6.6 (S55845-Z108) as needed. However, in the event the actuator needs replacement as well when replacing the valve, ASZ6.5 stem heating elements must be replaced by ASZ6.6 on SAX series valves.

2.7 Valve sizing for fluids (water, heat transfer oil)

2.7.1 Procedure for valve sizing

Essential values and formulas required for valve sizing:

Sizing and selection of valves and actuators						
1	Determine the basic hydraulic circuit	-				
2	Determine Δp_{VR} or Δp_{MV}	<p>One of the factors that determines control stability is the valve authority P_V. It is determined depending on the type of header and the hydraulic circuit</p> <ul style="list-style-type: none"> Header with pressure and variable volumetric flow Header with pressure and constant volumetric flow, or Header with low differential pressure and variable volumetric flow <p>Continue with Δp_{VR} Continue with Δp_{MV}</p>				
3	Determine Δp_{V100}	$\Delta p_{V100} \geq \frac{\Delta p_{VR}}{2}$ $\Delta p_{V100} \geq \Delta p_{MV}$				
4	Determine the volumetric flow \dot{V}_{100}	<p>Determine \dot{V}_{100} depending on the type of medium</p> <p>Water without antifreeze: Water with antifreeze, heat transfer oil:</p> $\dot{V}_{100} = \frac{\dot{Q}_{100}}{1.163 \cdot \Delta T}$ $\dot{V}_{100} = \frac{\dot{Q}_{100} \cdot 3600}{c \cdot \rho \cdot \Delta T}$ <p>For steam, see "0 Sizing valves for steam", page 49</p>				
5	Determine the k_{VS} value	<p>There are different ways to determine the k_{VS} value:</p> <table border="1"> <tr> <td> <p>Flow chart</p>  </td> <td> <p>By way of calculation</p> $k_V = \frac{\dot{V}_{100}}{\sqrt{\frac{\Delta p_{V100}}{100}}}$ <p>Determine the k_{VS} value according to:</p> <p>$0.85 \cdot k_V - \text{value} < k_{VS} - \text{value}$ ¹⁾</p> <p>or within the following band:</p> <p>$0.74 \cdot k_{VS} - \text{value} < k_V < 1.175 \cdot k_{VS} - \text{value}$</p> </td> <td> <p>HIT sizing and selection:</p> <p>www.siemens.com/hit</p> </td> <td> <p>Valve slide rule</p>  </td> </tr> </table> <p>This procedure shows the mathematical approach. The following examples make use of the flow chart and show the way of calculation</p>	<p>Flow chart</p> 	<p>By way of calculation</p> $k_V = \frac{\dot{V}_{100}}{\sqrt{\frac{\Delta p_{V100}}{100}}}$ <p>Determine the k_{VS} value according to:</p> <p>$0.85 \cdot k_V - \text{value} < k_{VS} - \text{value}$ ¹⁾</p> <p>or within the following band:</p> <p>$0.74 \cdot k_{VS} - \text{value} < k_V < 1.175 \cdot k_{VS} - \text{value}$</p>	<p>HIT sizing and selection:</p> <p>www.siemens.com/hit</p>	<p>Valve slide rule</p> 
<p>Flow chart</p> 	<p>By way of calculation</p> $k_V = \frac{\dot{V}_{100}}{\sqrt{\frac{\Delta p_{V100}}{100}}}$ <p>Determine the k_{VS} value according to:</p> <p>$0.85 \cdot k_V - \text{value} < k_{VS} - \text{value}$ ¹⁾</p> <p>or within the following band:</p> <p>$0.74 \cdot k_{VS} - \text{value} < k_V < 1.175 \cdot k_{VS} - \text{value}$</p>	<p>HIT sizing and selection:</p> <p>www.siemens.com/hit</p>	<p>Valve slide rule</p> 			
6	Check the resulting differential pressure Δp_{V100}	<p>The resulting differential pressure Δp_{V100} is used for calculating the valve authority P_V:</p> $\Delta p_{V100} = 100 \cdot \left(\frac{\dot{V}_{100}}{k_{VS}} \right)^2$				
7	Select a suitable line of valves	<p>Select the type of valve (2-port, 3-port, or 3-port valve with bypass):</p> <ul style="list-style-type: none"> Type of connection (flanged, externally or internally threaded, soldered) PN class Nominal size DN Maximum or minimum medium temperature Type of medium 				
8	Check the valve authority P_V (control stability)	<p>Check P_V with the resulting differential pressure Δp_{V100}:</p> <ul style="list-style-type: none"> Header with pressure and variable volumetric flow Header with pressure and constant volumetric flow, or Header with low differential pressure and variable volumetric flow $P_V = \frac{\Delta p_{V100}}{\Delta p_{VR}}$ $P_V = \frac{\Delta p_{V100}}{\Delta p_{V100} + \Delta p_{MV}}$				
9	Select the actuator	<p>Select the actuator according to the following criteria:</p> <ul style="list-style-type: none"> Operating voltage Positioning signal Positioning time Spring return function Auxiliary functions 				
10	Check the working ranges	<p>Differential pressure $\Delta p_{max} > \Delta p_{V0}$</p> <p>Closing pressure $\Delta p_s > H_0$</p>				
11	Valve and actuator	Write down product and stock number of the selected valve and actuator				

¹⁾ Experience shows that the selected k_{VS} value is usually too high. To the benefit of a higher valve authority Siemens recommends to check sensibly whether a valve with a k_{VS} value of approx. 85 % of

the calculated k_{vs} value is possible. If this is not possible, the second rule applies.

2.7.2 Flow chart

Liquids

Kinematic viscosity $\nu < 10 \text{ mm}^2/\text{s}$

Note

This is an example of a flow chart for V..F53.. and does not apply to all large-stroke valves.

2.7.3 Impact of liquid properties on valve sizing

Valves are sized based on the volumetric flow passing through them. The most important characteristic of a valve is its k_{vs} value. Since this value is determined with water at a temperature of 5...30 °C and a differential pressure Δp of 100 kPa (1 bar), additional influencing factors must be taken into consideration if the properties of the medium passing through the valve are different.

The following properties of a medium affect valve sizing:

- The density ρ and the specific heat capacity c have a direct impact on the volumetric flow, which transfers the required amount of heat or cooling energy
- The kinematic viscosity ν influences the flow conditions (laminar or turbulent) in the valve and thus the differential pressure Δp at a given volumetric flow V

2.7.3.1 Density ρ

The amount of heat Q carried by a liquid depends on the available mass flow m , the specific heat capacity c , and the temperature spread ΔT :

$$\dot{Q} = \dot{m} \cdot c \cdot \Delta T$$

In the HVAC field, calculations are usually based on the volumetric flow V , resulting from the available mass flow m and the density ρ :

$$\dot{Q} = \dot{V} \cdot \rho \cdot c \cdot \Delta T$$

Within the temperature range normally used in the HVAC field, the density ρ of water is assumed to be about 1000 kg/m³ and the specific heat capacity c 4.19 kJ/(kg·K). This makes it possible to apply a simplified formula with a constant of 1.163 kWh/(m³·K) for calculating the volumetric flow V in m³/h:

$$\dot{V} = \frac{\dot{Q}}{1.163 \cdot \Delta T}$$

The rated capacity Q_{100} of a plant with the valve fully open is calculated with the following formula:

$$\dot{V}_{100} = \frac{\dot{Q}_{100}}{1.163 \cdot \Delta T}$$

For watery solutions, such as mixtures of water and antifreeze, or other liquids like heat transfer oils, refer to the chapters below.

2.7.3.2 Specific heat capacity c

The amount of heat Q carried by a liquid depends on the available mass flow m , the specific heat capacity c , and the temperature spread ΔT .

Within the temperature range normally used in the HVAC field, the specific heat capacity c of water changes only slightly. Therefore, the approximate value used for the specific heat capacity c is 4.19 kJ/(kg·K). This makes it possible to apply a simplified formula with a constant of 1.163 kWh/(m³·K) for calculating the volumetric flow V in m³/h:

$$\dot{V} = \frac{\dot{Q}}{1.163 \cdot \Delta T}$$

If watery solutions, such as mixtures of water and antifreeze, or other liquids like heat transfer oils are used for the transmission of heat, the required volumetric flow

V is to be calculated with the density ρ and the specific heat capacity c at the operating temperature:

$$\dot{V} = \frac{\dot{Q}}{\rho \cdot c \cdot \Delta T}$$

The specific heat capacity of liquids is specified in trade literature. For mixtures, the specific heat capacity c is calculated on the basis of the mixture's mass proportions m_1 and m_2 :

$$c_{\text{Gemisch}} = \frac{m_1 \cdot c_1 + m_2 \cdot c_2}{m_1 + m_2}$$

In the case of heating applications, the specific heat capacity c_1 or c_2 at the highest temperature must be used, and in the case of cooling applications that at the lowest temperature.

2.7.3.3 Kinematic viscosity ν

The kinematic viscosity ν affects the type of flow (laminar or turbulent) and thus the friction losses inside the valve. It has a direct impact on the differential pressure at a given volumetric flow.

The kinematic viscosity ν is specified either in mm^2/s or centistokes (cSt):
 $1 \text{ cSt} = 10^{-6} \text{ m}^2/\text{s} = 1 \text{ mm}^2/\text{s}$

Water at a temperature of between 5 and 30 °C is used to determine the k_{vs} value as a comparison value. Within this temperature range, water has a kinematic viscosity of 1.6 to 0.8 mm^2/s . The flow inside the valve is turbulent.

When sizing valves for media with other kinematic viscosities ν , a correction must be made. Up to a kinematic viscosity ν of less than 10 mm^2/s , the impact is negligible since it is smaller than the permissible tolerance of the k_{vs} value (+/- 10 %).

In general practice, the correction is made by applying a correction factor F_R , which gives consideration to the different flow and friction conditions when calculating the k_{vs} value.

F_R is the factor used for the impact of the valve's Reynolds number. It must be applied when there is nonturbulent flow in the valve, when the differential pressure is low, for example, in the case of high-viscosity fluids, very low flow coefficients, or combinations of them. It can be determined by way of experiment.

F_R = flow coefficient for nonturbulent flow conditions divided by the flow coefficient ascertained under the same plant conditions for turbulent flow
 (EN 60534-2-1[2011])

k_v value under nonturbulent flow conditions

$$k_v = \frac{V_{100}}{F_R} \cdot \frac{1}{\sqrt{\frac{\Delta p_{100}}{100}}}$$

Correction factor F_R for different kinematic viscosities ν

Kinematic viscosity [mm ² /s]	Correction factor F_R	Kinematic viscosity [mm ² /s]	Correction factor F_R
2000	0.52	60	0.73
1500	0.53	40	0.77
1000	0.55	30	0.8
800	0.56	25	0.82
600	0.57	20	0.83
400	0.60	15	0.86
300	0.61	10	0.90
250	0.62	8	(0.93) ¹⁾
200	0.64	6	(0.94) ¹⁾
150	0.66	4	(0.95) ¹⁾
100	0.69	3	(0.97) ¹⁾
80	0.70		

¹⁾ Impact in the case of kinematic viscosities up to 10 mm²/s is negligible

2.7.4 Influencing factors with selected groups of liquids

Media properties to be considered for a few selected groups of liquids:

	Density ρ	Specific heat capacity c	Kinematic viscosity ν
Formula	$\dot{V}_{100} = \frac{\dot{Q}_{100} \cdot 3600}{c \cdot \rho \cdot \Delta T}$	$\dot{V}_{100} = \frac{\dot{Q}_{100} \cdot 3600}{c \cdot \rho \cdot \Delta T}$	$k_v = \frac{\dot{V}_{100}}{F_R} \cdot \frac{1}{\sqrt{\frac{\Delta p_{100}}{100}}}$
Group of liquids			
Water	No	No	No ($F_R = 1$)
Water with antifreeze	Yes	Yes	Yes
Heat transfer oils	Yes	Yes	Yes
Brines	Yes	Yes	Yes

Notes on water and water with antifreeze

The HVAC Integrated Tool (HIT) supports sizing and selection of valves for water and water with antifreeze (www.siemens.com/hit).

Notes on heat transfer oils and brines

When sizing valves for use with heat transfer oils or brines, the medium properties specified by the suppliers must be taken into account:

- Specific heat capacity c
- Kinematic viscosity ν
- Specific density ρ
- During the heating up phase, the kinematic viscosity ν can reach a high level while the volumetric flow V and thus the available amount of heat $Q_{\text{heating up phase}}$ are much smaller than planned. This must be taken into account during the planning phase and when sizing the valves, see "2.9.3 Example for heat transfer oil", page 54.

2.7.5 Rangeability S_v , minimum controllable output Q_{\min}

When sizing and selecting a valve, it must be ensured that – in the controlled operating state – the output does not drop below the minimum controllable output Q_{\min} . Otherwise, the controlling element only regulates in on/off mode within the range of the initial flow surge. On/off mode reduces the plant's energy efficiency and adversely affects the controlling element's life.

The rangeability S_v is an important characteristic used for assessing the controllable range of a controlling element.

The smallest volumetric flow k_{vR} that can be controlled is the volumetric flow passing through the valve when it opens. Output Q_{\min} is the smallest output of a consumer (e.g. of a radiator) that can be controlled in modulating mode.

$$S_v = \frac{k_{vS}}{k_{vR}}$$

For more detailed information on the subject, refer to the brochure "Hydraulics in building systems" (ordering no. 0-91917-en).

2.8 Sizing valves for steam

Since steam is compressible, valve sizing for steam must be based on other criteria. The most important characteristic of compressible flow is that the speed of flow in the throttling section can only increase up to the speed of sound. When this limit is reached, the speed of flow and thus the volumetric flow, or the steam mass flow, no longer increases, even if the differential pressure Δp rises. To ensure good controllability and favorably priced valve selection, it is advisable to have the differential pressure in normal operation as close as possible to the critical pressure ratio.

Before starting valve sizing, the plant-related process parameters and the prevailing operating state must be defined:

- Absolute steam pressure [kPa abs], [bar abs]
- Temperature of saturated or superheated steam [°C]
- Differential pressure Δp_{\max} in normal operation

The dryness of saturated steam at the valve's inlet must be > 0.98 .

During plant startup or shutdown, supercritical pressure conditions can occur:

- In terms of potential damage to the valve, a subcritical pressure ratio is far less crucial since the speed of flow lies below the speed of sound, material abrasion is reduced, and the noise level is lower

Sizing procedure

1. Calculate the steam mass flow m based on the amount of energy required Q_{100} , the steam pressure, and the steam temperature.
2. Determine whether the pressure ratio is in the sub- or supercritical range.
3. Determine the k_{vs} value based on the steam mass flow and the steam pressure.

Steam mass flow $\dot{m} = \frac{Q_{100} \cdot 3600}{r_{p1}}$	Pressure ratio = $\frac{p_1 - p_3}{p_1} \cdot 100\%$
---	--

Calculation of k_{vs} value for steam

Subcritical range

$$\frac{p_1 - p_3}{p_1} \cdot 100\% < 42\%$$

Pressure ratio $< 42\%$ subcritical

$$k_{vs} = 4.4 \cdot \frac{\dot{m}}{\sqrt{p_3 \cdot (p_1 - p_3)}} \cdot k$$

Supercritical range

$$\frac{p_1 - p_3}{p_1} \cdot 100\% \geq 42\%$$

Pressure ratio $\geq 42\%$ supercritical
(not recommended)

$$k_{vs} = 8.8 \cdot \frac{\dot{m}}{p_1} \cdot k$$

Q_{100} = rated capacity in kW

r_{p1} = specific heat capacity of steam in kJ/kgK

p_1 = absolute pressure at the valve inlet in kPa (prepressure)

p_3 = absolute pressure at the valve outlet in kPa

\dot{m} = steam mass flow in kg/h

k = factor for superheating the steam = $1 + 0.0012 \times \Delta T$ (for saturated steam, $k = 1$)

ΔT = temperature spread in K of saturated steam and superheated steam

Note The level of absolute pressure p_1 at the valve inlet must be at least such that the absolute pressure p_3 at the valve outlet is higher than the atmospheric pressure.

Notes on the supercritical range

When there is a pressure ratio $(p_1 - p_3) / p_1 > 0.42$, the flow passing through the narrowest section of the valve reaches the speed of sound. This can lead to higher noise levels. A throttling system operating at a lower noise level (multistage pressure reduction, damping throttle by the outlet) alleviates the problem.

Subcritical < 42 %

- Steam-controlled heat transfer medium without condensation
- Shutoff valve on the steam side of condensation-controlled heat transfer media

Supercritical ≥ 42 %

- Steam humidifier
- Steam-controlled heat transfer medium with condensation in the heat exchanger

Recommendation for differential pressure

For saturated and superheated steam, the differential pressure Δp_{max} across the valve should be as close as possible to the critical pressure ratio.

Δp_{max}

Chart example: The chart of the selected valve must be observed. The detailed diagrams for the valve lines can be found in the respective data sheets. X and Y: Suitable actuators, depending on the 2-port valve

Water vapor table

1	Water	-
2	Wet steam	To be avoided
3	Saturated steam Superheated steam	Permissible operating range

1	Determine the basic hydraulic circuit	Injection circuit with 2-port valve
2	Determine Δp_{VR} or Δp_{MV}	With pressure and variable volumetric flow $\rightarrow \Delta p_{VR}$ $\Delta p_{VR} = 34 \text{ kPa}$
3	Determine Δp_{V100}	With pressure and variable volumetric flow $\rightarrow \Delta p_{V100} \geq \frac{\Delta p_{VR}}{2}$ $\Delta p_{V100} = 17 \text{ kPa}$
4	Determine the volumetric flow \dot{V}_{100}	$\dot{V}_{100} = \frac{Q_{100}}{1.163 \cdot \Delta T} = \frac{55 \text{ kW}}{1.163 \cdot (60^\circ\text{C} - 40^\circ\text{C})} = 2.36 \text{ m}^3/\text{h}$
5	Determine the k_{vs} value	<p><u>Flow chart</u></p> <p>Use the flow chart to determine the k_{vs} value:</p> <ol style="list-style-type: none"> k_{vs} value: 5 m³/h k_{vs} value: 6.3 m³/h <p><u>By way of calculation</u></p> $k_v = \frac{\dot{V}_{100}}{\sqrt{\frac{\Delta p_{V100}}{100}}} = \frac{2.36 \text{ m}^3/\text{h}}{\sqrt{\frac{17 \text{ kPa}}{100}}} = 5.7 \text{ m}^3/\text{h}$ <p>$k_{vs} \text{ value} \geq 0.85 \cdot 5.7 \text{ m}^3/\text{h} = 4.8 \text{ m}^3/\text{h} \rightarrow k_{vs} \text{ value} = 5 \text{ m}^3/\text{h} \text{ or } 6.3 \text{ m}^3/\text{h}$</p> <ol style="list-style-type: none"> k_{vs} value: 5 m³/h k_{vs} value: 6.3 m³/h
6	Check the resulting differential pressure Δp_{V100}	<p>First k_{vs} value: $\Delta p_{V100} = 100 \cdot \left(\frac{\dot{V}_{100}}{k_{vs}} \right)^2 = 100 \cdot \left(\frac{2.36 \text{ m}^3/\text{h}}{5 \text{ m}^3/\text{h}} \right)^2 = 22.3 \text{ kPa}$</p> <p>Second k_{vs} value: $\Delta p_{V100} = 100 \cdot \left(\frac{\dot{V}_{100}}{k_{vs}} \right)^2 = 100 \cdot \left(\frac{2.36 \text{ m}^3/\text{h}}{6.3 \text{ m}^3/\text{h}} \right)^2 = 14 \text{ kPa}$</p>
7	Select suitable line of valves	<ul style="list-style-type: none"> 2-port valve (resulting from the basic hydraulic circuit) Flanged (specified by the planner) PN class 16 (specified by the planner) Nominal size DN (resulting from the selected valve) Maximum medium temperature: 60 °C Type of medium: Water <p>\rightarrow 1st selection: VVF53.25-5 2nd selection: VVF53.20-6.3 or VVF53.25-6.3</p>

8	Check the valve authority P_V (control stability)	<p>Check P_V using the resulting differential pressure Δp_{V100}:</p> <p>First k_{vs} value: $P_V = \frac{\Delta p_{V100}}{\Delta p_{VR}} = \frac{22.3 \text{ kPa}}{34 \text{ kPa}} = 0.66$</p> <p>Second k_{vs} value: $P_V = \frac{\Delta p_{V100}}{\Delta p_{VR}} = \frac{14 \text{ kPa}}{34 \text{ kPa}} = 0.41$</p> <p>→ Higher valve authority P_V → k_{vs} value = 5 m³/h</p>
9	Select the actuator	<p>Select actuator according to the following criteria:</p> <ul style="list-style-type: none"> • Operating voltage • Positioning signal • Positioning time • Spring return function • Auxiliary functions
10	Check the working ranges	<p>Differential pressure $\Delta p_{max} > \Delta p_{V0}$</p> <p>Closing pressure $\Delta p_s > H_0$</p>
11	Select valve and actuator	<p>Type of valve: VVF53.25-5</p> <p>Type of actuator: According to the table</p>

2.9.2 Example for water: Heater with low differential pressure without main pump

1	Determine the basic hydraulic circuit	Mixing circuit
2	Determine Δp_{VR} or Δp_{MV}	<p>Header with low differential pressure and variable volumetric flow → Δp_{MV}</p> <p>$\Delta p_{MV} = \Delta p_{\text{piping}} + \Delta p_{\text{heat meter}} = 3 \text{ kPa} + 8 \text{ kPa} = 11 \text{ kPa}$</p>
3	Determine Δp_{V100}	<p>Header with low differential pressure and variable volumetric flow → $\Delta p_{V100} \geq \Delta p_{MV}$</p> <p>$\Delta p_{V100} = 11 \text{ kPa}$</p>
4	Determine the volumetric flow V_{100}	$\dot{V}_{100} = \frac{Q_{100}}{1.163 \cdot \Delta T} = \frac{70 \text{ kW}}{1.163 \cdot (60^\circ\text{C} - 45^\circ\text{C})} = 4 \text{ m}^3/\text{h}$
5	Determine the k_{vs} value	<p><u>Flow chart</u></p> <p>Use the flow chart to determine the k_{vs} value: k_{vs} value: 12 m³/h</p> <p><u>By way of calculation</u></p> $k_v = \frac{\dot{V}_{100}}{\sqrt{\frac{\Delta p_{V100}}{100}}} = \frac{4 \text{ m}^3/\text{h}}{\sqrt{\frac{11 \text{ kPa}}{100}}} = 12.1 \text{ m}^3/\text{h}$ <p>k_{vs} value $\geq 0.85 \cdot 12 \text{ m}^3/\text{h} = 10.2 \text{ m}^3/\text{h}$ → k_{vs} value = 10 m³/h</p> <p>k_{vs} value: 10 m³/h</p>

6	Check the resulting differential pressure Δp_{V100}	$\Delta p_{V100} = 100 \cdot \left(\frac{\dot{V}_{100}}{k_{Vs}} \right)^2 = 100 \cdot \left(\frac{4 \text{ m}^3/\text{h}}{10 \text{ m}^3/\text{h}} \right)^2 = 16 \text{ kPa}$
7	Select suitable line of valves	<ul style="list-style-type: none"> • 2-port valve (resulting from the basic hydraulic circuit) • Flanged (specified by the planner) • PN class 16 (specified by the planner) • Nominal size DN (resulting from selected valve) • Maximum medium temperature: 60 °C • Type of medium: Water <p>→ Selection: VXF53.25-10</p>
8	Check the valve authority P_V (control stability)	<p>Check P_V using the resulting differential pressure Δp_{V100}:</p> $P_V = \frac{\Delta p_{V100}}{\Delta p_{V100} + \Delta p_{MV}} = \frac{16 \text{ kPa}}{16 \text{ kPa} + 11 \text{ kPa}} = 0.59$
9	Select the actuator	<p>Select actuator according to the following criteria:</p> <ul style="list-style-type: none"> • Operating voltage • Positioning signal • Positioning time • Spring return function • Auxiliary functions
10	Check the working ranges	<p>Differential pressure $\Delta p_{\max} > \Delta p_{V0}$</p> <p>Closing pressure $\Delta p_s > H_0$</p>
11	Select valve and actuator	<p>Type of valve: VXF53.25-10</p> <p>Type of actuator: According to the table</p>

2.9.3 Example for heat transfer oil

As outlined in chapter Impact of liquid properties on valve sizing, page 45, when sizing a valve, the density ρ , the specific heat capacity c , and the kinematic viscosity ν must be taken into consideration. Also, to ensure correct and efficient operation, a closer look should be taken at the controlled mode and the startup mode.

Properties	
Description	Mobiltherm 603
Max. permissible flow temperature	285 °C
Max. permissible film temperature	315 °C
Kinematic viscosity at 20 °C	50.5 mm ² /s
Kinematic viscosity at 100/200/300 °C	4.2/1.2/0.58 mm ² /s
Density at 20 °C	859 kg/m ³
Density at 100/200/300 °C	811/750/690 kg/m ³
Specific heat capacity c at 20 °C	1.89 kJ/kgK
Specific heat capacity c at 100/200/300 °C	2.18/2.54/2.91 kJ/kgK

When planning and commissioning a plant or when sizing valves, the suppliers' specifications must be observed. The experience and know-how of the suppliers help select the right type of heat transfer oil.

Plant data	Consumer: Air-heat transfer oil heat exchanger Differential pressure Δp_{VR} : 50 kPa (0.5 bar) Flow temperature T_{VL} : 200 °C Return temperature T_{RL} : 150 °C Required capacity Q_{100} : 55 kW Basic hydraulic circuit: Throttling circuit	
Operating data	Controlled mode when heated up	Heating up mode
Required capacity Q	$Q_{100} = 55 \text{ kW}$	Q is undefined
Temperature spread ΔT	50 K	-
Determine the volumetric flow \dot{V}_{100}	$\dot{V}_{100} = \frac{\dot{Q}_{100} \cdot 3600}{c \cdot \rho \cdot \Delta T}$ $\dot{V}_{100} = \frac{55 \text{ kW} \cdot 3600}{2,54 \text{ kJ/kgK} \cdot 750 \text{ kg/m}^3 \cdot 50 \text{ K}}$ $\dot{V}_{100} = 2,08 \text{ m}^3/\text{h}$	-
Differential pressure Δp_{V100}	With pressure and variable volumetric flow $\rightarrow \Delta p_{V100} \geq \frac{\Delta p_{VR}}{2}$ $\rightarrow \Delta p_{V100} = 25 \text{ kPa (0.25 bar)}$	Must be calculated
Flow temperature T_{VL}	200 °C	Approx. 20 °C
Kinematic viscosity ν	At 200 °C: 1.2 mm ² /s	50.5 mm ² /s
Correction factor F_R	At 200 °C: 1 Kinematic viscosity $\nu < 10 \text{ mm}^2/\text{s}$	At 20 °C: 0.75 Interpolated according to the correction factor table on page 47
Determine the k_{vs} value	$k_v = \frac{\dot{V}_{100}}{F_R} \cdot \frac{1}{\sqrt{\frac{\Delta p_{V100}}{100}}}$ $F_R = 1$ $k_v = \frac{\dot{V}_{100}}{\sqrt{\frac{\Delta p_{V100}}{100}}} = \frac{2,08 \text{ m}^3/\text{h}}{\sqrt{\frac{25 \text{ kPa}}{100}}} = 4,16 \text{ m}^3/\text{h}$ $k_{vs}\text{-Wert} \geq 0,85 \cdot 4,16 \text{ m}^3/\text{h} = 3,54 \text{ m}^3/\text{h}$ $\rightarrow k_{vs} \text{ value} = 5 \text{ m}^3/\text{h}$	-
Volumetric flow resulting from the selected k_{vs} value	$\dot{V}_{100} = k_{vs} \cdot F_R \cdot \sqrt{\frac{\Delta p_{V100}}{100}}$ $\dot{V}_{100} = 5 \text{ m}^3/\text{h} \cdot 1 \cdot \sqrt{\frac{25 \text{ kPa}}{100}}$ $\dot{V}_{100} = 2,5 \text{ m}^3/\text{h}$	$\dot{V}_{100} = k_{vs} \cdot F_R \cdot \sqrt{\frac{\Delta p_{V100}}{100}}$ $\dot{V}_{100} = 5 \text{ m}^3/\text{h} \cdot 0,75 \cdot \sqrt{\frac{25 \text{ kPa}}{100}}$ $\dot{V}_{100} = 1,9 \text{ m}^3/\text{h}$ $\rightarrow \text{In the heating up phase, the volumetric flow is reduced by 5 \%!$
Select the 2-port valve	VVF63.25-5	

2.9.4 Example for steam

As outlined in chapter Sizing valves for steam, page 49, it must be determined first whether a supercritical or subcritical pressure ratio exists in the plant.

Example 1: By way of calculation

	Saturated steam = 151.8 °C Prepressure p ₁ = 500 kPa (5 bar) Steam mass flow ṁ = 460 kg/h	
Given	Pressure ratio = 30 %	Pressure ratio ≥ 42 % (supercritical permitted)
	Subcritical pressure ratio	Supercritical pressure ratio
Required	k _{vs} , valve type	k _{vs} , valve type
Solution	$p_3 = p_1 - \frac{30\% \cdot p_1}{100\%}$ $p_3 = 500 \text{ kPa} - \frac{30\% \cdot 500 \text{ kPa}}{100\%} = 350 \text{ kPa (3.5bar)}$ $k_v = 4.4 \cdot \frac{460 \text{ kg/h}}{\sqrt{350 \text{ kPa} \cdot (500 \text{ kPa} - 350 \text{ kPa})}} \cdot 1$ $k_v = 8.83 \text{ m}^3/\text{h}$	$k_v = 8.8 \cdot \frac{460 \text{ kg/h}}{500 \text{ kPa}} \cdot 1$ $k_v = 8.09 \text{ m}^3/\text{h}$
Selected	k _{vs} = 10 m ³ /h → VVF53.25-10	k _{vs} = 8 m ³ /h → VVF53.25-8

Example 2: With chart

Given	Saturated steam = 111.4 °C Prepressure p ₁ = 150 kPa (1.5 bar) Steam mass flow ṁ = 75 kg/h Differential pressure = 40 kPa (0.4 bar)
Required	k _{vs} , valve type
Solution	<ol style="list-style-type: none"> Vertical line upward to an absolute prepressure p₁ = 1.5 bar (150 kPa). Horizontal line to the right to the point of intersection 1.5 bar (150 kPa) and differential pressure 0.4 bar (40 kPa). Vertical line downward to 75 kg/h. Point of intersection k_{vs} value Select available k_{vs} value of VVF.. valve lines. Selected k_{vs} value: 5 m³/h.
Selected	k _{vs} value: 5 m ³ /h → VVF53.25-5

Example 3: With chart

Given	Superheated steam = 251.8 °C Saturated steam = 151.8 °C Superheating ΔT = 100 K Prepressure p ₁ = 500 kPa (5 bar) Steam mass flow ṁ = 150 kg/h Differential pressure = 200 kPa (2 bar)
Required	k _{vs} , valve type
Solution	<ol style="list-style-type: none"> Vertical line upward to an absolute prepressure p₁ = 5 bar (500 kPa). Horizontal line to the right to the point of intersection 5 bar (500 kPa) and differential pressure 2 bar (200 kPa). Scale "Superheated steam": Along the line at 150 kg/h upward to superheating at 100 K, then the vertical line upward. Point of intersection k_{vs} value Select available k_{vs} value of VVF.. valve lines. Selected k_{vs} value: 3.15 m³/h.
Selected	k _{vs} value: 3.15 m ³ /h → VVF53.15-3.2

2.10 Valve characteristics

2.10.1 2-port valves

For valves:

 VVF53.250-630K
 VVF63.125-220K
 VVF63.150-315K

0...30 %: Linear

30...100 %: Equal-percentage

$n_{gl} = 3$ as per VDI / VDE 2173

For certain valve lines and high k_{vS} values, the valve characteristic is optimized for maximum volumetric flow k_{V100} .

0...100 %: Linear

Note

The characteristic curve shape is only shown as an example and can be looked up in the corresponding data sheets.

2.10.2 3-port valves

Throughport A-AB

0...30 %: Linear

30...100 %: Equal-percentage

$n_{gl} = 3$ as per VDI / VDE 2173

For certain valve lines and high k_{vS} values, the valve characteristic is optimized for maximum volumetric flow k_{V100} .

Bypass B-AB

0...100 %: Linear

Port AB = constant flow

Port A = variable flow

Port B = bypass (variable flow)

Mixing: Flow from port A and port B to port AB

Diverting: Flow from port AB to port A and port B

For valves:

Bypass B-AB

0...100 %: Linear

2.11 Operating pressure and medium temperature

2.11.1 ISO 7005 and EN 1092 – a comparison

ISO 7005 and EN 1092 cover PN-classified, round flanges for pipes, valves, plain fittings and accessories, plus their dimensions and tolerances, categorized according to different types of materials.

Both standards also contain the assignment of pressures and medium temperatures.

The connecting dimensions, flange and face types plus descriptions conform to the relevant ISO 7005 standards.

- ISO 7005, part 1: Steel flanges
- ISO 7005, part 2: Cast iron flanges
- ISO 7005, part 3: Flanges made of copper alloys

Since the valves covered by this document are used throughout the world, the international standard ISO 7005 was selected as a basis. The information given below explains the differences between ISO 7005 and EN 1092.

EN 1092: Part 1,
steel flanges

The international standard ISO 7005-1 on steel flanges was used as a basis for the development of EN 1092. EN 1092 deviates from ISO 7005 in the following ways:

- It solely covers flanges with PN designation
- A number of technical requirements of flanges originating from DIN standards have been changed

The differences between EN 1092-1 and ISO 7005-1 are as follows:

- In many cases, the pressure-temperature assignments of this standard have been reduced, either by limiting the assignments at lower temperatures – which may no longer exceed the value of the PN class – or by increasing the rate at which the admissible pressure drops on temperature rise
- In addition to the PN 2.5 – PN 40 range of flanges originating from DIN standards, which is defined in ISO 7005, EN 1092 also contains flanges up to PN 400

EN 1092: Part 2,
cast iron flanges

In terms of flanges of the same PN class, this standard refers to ISO 7005-2 and ISO 2531. Flange types and connecting dimensions are compatible with the same DN and PN class of ISO 7005 and ISO 2531.

- Pressure-temperature assignments: There are no differences between EN 1092-2 and ISO 7005-2

EN 1092: Part 3, flanges
made of copper alloys

In terms of flanges of the same PN class, this standard refers to ISO 7005-3. Flange types and connecting dimensions are compatible with the same DN and PN class of ISO 7005.

- Pressure-temperature assignments: There are no differences between EN 1092-3 and ISO 7005-3

To be able to make use of the permissible operating pressures and operating temperatures according to EN 1092-1 as listed in the following tables/graphs, high-quality steel is required when using steel flanges. Otherwise, the permissible plant operating pressures must be reduced as specified in EN 1092-1.

2.11.2 PN 6 valves with flanged connections

Liquids
with V..F22..

- Curve for saturated steam; steam forms below this line
- Operating pressure according to EN 1092, valid for 2-port valves with blank flange

Operating pressure and operating temperatures as per ISO 7005 and EN 1092

Note

- All relevant local directives must be observed

2.11.3 PN 10 valves with flanged connections

Liquids
with V..F32..
V..F42..

Medium temperature [°C]

- Curve for saturated steam; steam forms below this line
- Operating pressure according to EN 1092, valid for 2-port valves with blank flange

Operating pressure and operating temperatures as per ISO 7005 and EN 1092

Notes

- V..F42..: Applies when these valves are used in PN 10 plants
- All relevant local directives must be observed

2.11.4 PN 16 valves with flanged connections

Liquids
with V..F42..

- Curve for saturated steam; steam forms below this line
- Operating pressure according to EN 1092, valid for 2-port valves with blank flange

Operating pressure and operating temperatures as per ISO 7005 and EN 1092

Note

- All relevant local directives must be observed

Liquids
with V..F43..
V..F53..
V..F63..

- Curve for saturated steam; steam forms below this line
- Operating pressure according to EN 1092, valid for 2-port valves with blank flange

Operating pressure and operating temperatures as per ISO 7005, EN 1092 and EN 12284

Notes

- V..F53..: Applies when these valves are used in PN 16 plants
- All relevant local directives must be observed

VVG41..

1	Water	-
2	Wet steam	To be avoided
3	Saturated steam Superheated steam	Permissible operating range

VVI41..

1	Water	-
2	Wet steam	To be avoided
3	Saturated steam Superheated steam	Permissible operating range

2.12 Cavitation

Due to high speeds of the medium in the narrowest section of the valve, local underpressure occurs (p_2). If this pressure drops below the medium's boiling pressure, cavitation occurs (steam bubbles), possibly leading to material removal (abrasion). Also, when cavitation sets in, the noise level increases abruptly. Cavitation can be avoided by limiting the pressure differential across the valve as a function of the medium temperature and the prepressure.

--- Progression of speed
 — Progression of pressure p

- Δp_{\max} = differential pressure with valve almost fully closed at which cavitation can largely be avoided
- p_1 = static pressure at valve inlet
- p_3 = static pressure at valve outlet
- M = pump
- ϑ = water temperature

Example for low-temperature hot water

Pressure p_1 at valve inlet: 500 kPa (5 bar)

Water temperature: 120 °C

From the chart above it can be seen that with the valve almost fully closed, the maximum permissible differential pressure Δp_{\max} is 200 kPa (2 bar).

Example for cold water Spring water cooling as an example for avoiding cavitation:

- Cold water = 12 °C
- p_1 = 500 kPa (5 bar)
- p_4 = 0 kPa (0 bar)
(atmospheric pressure)
- Δp_{max} = 300 kPa (3 bar)
- $\Delta p_{3-3'}$ = 20 kPa (0.2 bar)
- Δp_D (throttle) = 180 kPa (1.8 bar)
- $p_{3'}$ = pressure downstream
from the consumer in
kPa

Note

To avoid cavitation in the case of cold water circuits, it must also be made certain that there is sufficient static counter-pressure at the valve's outlet. This can be ensured by installing a throttling valve downstream from the heat exchanger, for example. In that case, the maximum pressure drop across the valve should be selected according to the 80 °C curve in the flow chart above on page 65.

2.13 Medium quality and medium treatment

All relevant local directives must be observed whenever it comes to water quality, corrosion or contamination.

2.13.1 Water

Note	<ul style="list-style-type: none">• Water treatment as per VDI 2035 to avoid boiler scale and damage due to corrosion on the water side• The requirements of DIN EN 12953-10 should be observed• Local guidelines and directives should be observed
Planning	Install a strainer (dirt trap).
Installation and commissioning	<ul style="list-style-type: none">• The company making the installation is responsible for the water quality in HVAC plants• Before filling a hydraulic HVAC circuit with water, the installer must observe the specifications of suppliers regarding water quality. If such specifications or regulations are not observed, severe damage to the plant can occur• When commissioning a plant, the company that made the installation is obliged to write a commissioning report including information about water quality and filling (plant volume) and, if necessary, about water treatment and the additives used
Recommendation	Keep a plant record.
Maintenance and service	<p>The installer should check hydraulic HVAC circuits at least once a year.</p> <p>Before adding water to a hydraulic HVAC circuit, the installer must observe the specifications of suppliers regarding water quality (water treatment as per VDI 2035). If such specifications or regulations are not observed, severe damage to the plant can occur.</p> <p>When adding water at a later stage, the company that made the installation is obliged to write a commissioning report including information about water quality and the filling (plant volume) and, if necessary, about water treatment and the additives used.</p>
Recommendation	To prevent boiler scale and damage resulting from corrosion, the water quality in open or closed plants must be checked at regular intervals. The plant record must always be kept up to date.

2.13.2 Water with antifreeze

Note	For water with antifreeze, such as ethylene glycol or propylene glycol, the supplier-specific values for the density ρ , the specific heat capacity c , and the kinematic viscosity ν are to be determined by way of concentration and medium temperature. These values must be observed when sizing valves to make certain that correct k_{vs} values are obtained.
------	---

In the case of antifreeze concentrations with a kinematic viscosity of $< 10 \text{ mm}^2/\text{s}$, correction factors for the sizing of valves are not required. Refer to chapter Impact of liquid properties on valve sizing, page 45.

Planning

- The type of antifreeze (product and dosage) added to the system must be approved by the supplier for use in HVAC plants
- If several additives are used (e.g. antifreeze and hardness stabilizers), the required combination must be approved by the same supplier
- Install a strainer (dirt trap)

Installation and commissioning

- The company making the installation is responsible for the correct antifreeze concentration and water quality in HVAC plants
- Before filling a hydraulic HVAC circuit with a medium, the installer must observe the specifications of the supplier. If such specifications or regulations are not observed, severe damage to the plant can occur
- When commissioning a plant, the company that made the installation is obliged to write a commissioning report including information about water quality, antifreeze concentration and filling (plant volume) and, if necessary, about water treatment and the additives used

Recommendation

Keep a plant record.

Maintenance and service

The installer should check hydraulic HVAC circuits at least once a year. According to supplier specifications, the antifreeze concentration, the pH value, and the concentration of inhibitors must be checked once a year, for example.

Recommendation

The antifreeze concentration and water quality in open or closed HVAC plants must be checked at regular intervals. The plant record must always be kept up to date.

2.13.3 Deionized, demineralized water and super-clean water

Note These media have an impact on valve selection (material of O-rings, gaskets, plug/seat, and valve body). Compatibility must be checked.

Deionized water	Demineralized water	Super-clean water
The ions of salts contained in the water have been removed	The minerals contained in the water have been removed	Intensely treated water with a high specific resistance and containing no organic substances

To avoid corrosion and to ensure a long service life of the valves, gaskets and plugs, the following limits must be observed:

- Oxygen: < 0.02 mg/l
- pH value: 8.2...8.5
- Electric conductance: < 5 µSi
- Sum of alkaline earths: < 0.0051 mmol/l
- Hardness: < 0.03 °dH

Planning

- The media must be approved by the supplier for use in HVAC plants
- Install a strainer (dirt trap)

Installation and commissioning

- The company making the installation is responsible for the quality of the media used
- Before filling a hydraulic HVAC circuit with a medium, the installer must observe the supplier's specification. If such specifications or regulations are not observed, severe damage to the plant can occur
- When commissioning a plant, the company that made the installation is obliged to write a commissioning report including information about medium quality and filling (plant volume) and, if necessary, about water treatment and additives used

Recommendation Keep a plant record.

Maintenance, service The installer should check hydraulic HVAC circuits at least once a year.

Recommendation The quality of the medium used in open or closed HVAC plants must be checked at regular intervals. The plant record must always be kept up to date.

2.13.4 Heat transfer oil (thermal oil)

Note

Heat transfer oil has an impact on valve selection (material of O-rings and gaskets). Compatibility must be checked.

When planning and commissioning a plant or when sizing valves, the suppliers' specifications must be observed. To make certain the right type of heat transfer oil is used, one should rely on the suppliers' experience and know-how.

When using heat transfer oil (thermal oil), the following supplier-specific values must be taken into consideration:

- Correction factor F_R , if the supplier-specific kinematic viscosity ν exceeds $10 \text{ mm}^2/\text{s}$
- Density ρ
- Room and operating temperature
- During the heating up phase, the kinematic viscosity ν is very high. The volumetric flow is much smaller than planned and thus the available amount of energy $Q_{\text{heating up phase}}$ as well. This must be taken into account during the planning phase and when sizing the valve

Refer to chapter Impact of liquid properties on valve sizing, page 45.

Types of heat transfer oil

- Heat transfer media on the basis of mineral oil
- Synthetic heat transfer fluids
- Organic heat transfer fluids as per DIN 4754
- Heat transfer media of a uniform substance or mixture
- Heat transfer oils on the basis of silicon

Planning

Install a strainer (dirt trap).

Installation and commissioning

- The company making the installation is responsible for the quality of the media used
- Before filling a hydraulic HVAC circuit with a medium, the installer must observe the supplier's specification. If such specifications or regulations are not observed, severe damage to the plant can occur
- When commissioning a plant, the company that made the installation is obliged to write a commissioning report including information about medium quality and filling (plant volume) and, if necessary, about water treatment and the additives used

Recommendation

Keep a plant record.

Maintenance and service

The installer should check hydraulic HVAC circuits at least once a year.

Before adding medium to a hydraulic HVAC circuit, the installer must observe the supplier's specification. If such specifications or regulations are not observed, severe damage to the plant can occur.

When adding medium at a later stage, the company that made the installation is obliged to write a commissioning report including information about the quality of the medium and the filling (plant volume) and, if necessary, about treatment and additives used.

Recommendation

The quality of the medium in open or closed plants must be checked at regular intervals. The plant record must always be kept up to date.

2.14 Engineering notes

2.14.1 Strainer (dirt trap)

Open and closed HVAC plants require a strainer (dirt trap). This improves the quality of the water, ensures proper functioning of the valve, and a long service life of the HVAC plant with its components.

2.14.2 Avoiding flow noise

To reduce flow noise, abrupt reductions in pipe diameters, tight pipe bends, sharp edges or reductions in the vicinity of valves should be avoided. A settling path should be provided.

Recommendation:

- $L \geq 10 \times DN$, at least 0.4 m

Also, the flow must be free from cavitation (refer to VVI41..., chapter 2.12 Cavitation page 65).

2.14.3 Avoiding false circulation

When 3-port valves in HVAC plants are fully closed, false circulation can occur when hot water rises or when water is pulled away near rectangular pipe connections.

Note

False circulation can be avoided by proper planning – with almost no extra cost – but remedy is usually very costly in existing plants.

Measures against false circulation

- Observe guide value for the water speed: 0.5...1 m/s.
The lower the water speed, the smaller the risk that the diverted flow pulls water from the critical piping section. If required, balancing valves can be installed to improve flow conditions
 - Observe a certain distance between bypass and collector/header or short-circuit:
 $H \geq 10 \times \text{pipe dia.}$, minimum 400 mm
- or
- Installation of a check valve or gravity brake R with small spring pressure in the critical piping section, aimed at ensuring a minimum flow in the opening range

- Welded elbows.

2.14.4 Thermal insulation

Insulated pipes and valves save energy.

Actuators must never be insulated. This is to make certain that heat produced by the actuator can be dissipated, thus preventing overheating.

Recommendation:
Thermal insulation of pipes and valves conforming to EnEV 2009

Recommendation ¹⁾

#	Type of pipes/valves	Minimum thickness of thermal insulation
1	Inside diameter up to 22 mm	20 mm
2	Inside diameter 22...35 mm	30 mm
3	Inside diameter 35...100 mm	Same as inside diameter
4	Inside diameter > 100 mm	100 mm
5	Through walls and ceilings, at pipe crossings and connections, at central network distributors	½ of requirements of # 1...4
6	Pipes of central heating systems which, after January 31, 2002, were installed between heated rooms of different users	½ of requirements of # 1...4
7	Pipes according to # 6 in the floor's structure	6 mm
8	Cooling energy distribution/cold water pipes and valves of room ventilation and air conditioning systems	6 mm

¹⁾ Applies to a heat conductance of 0.035 W/(m·K)

When using materials with a heat conductance other than 0.035 W/(m·K), the minimum thickness of the insulating layers must be appropriately adapted. For the conversion and heat conductance of insulating material, the calculation methods and data applied by established technical rules must be used.

2.15 Warranty

The engineering data listed in chapter "Type summary and equipment combinations" on page 15 are ensured only when the valves are used in connection with the specified Siemens actuators.

Note

If the valves are used in combination with actuators supplied by thirds, proper functioning must be ensured by the user himself and Siemens Building Technologies will assume no liability.

3 Handling

3.1 Mounting and installation

Note

The valves must be installed free from distortion:

3.1.1 Mounting positions

- 1) Only in combination with weather shield ASK39.1 and actuators SAX or SAV.
- 2) SA..61../MO are not suitable for outdoor application.

Mounting positions apply to both 2- and 3-port valves.

3.1.2 Direction of flow for liquids and steam

For general illustration and further details, refer to chapter "4.3 Technical and mechanical design", page 80.

2-port valves

 <p style="text-align: center;">A T → AB B</p>	 <p style="text-align: center;">AB T → A B</p>

3.1.3 Flanges

To ensure that flanges are correctly connected, the nominal, maximum and minimum tightening torques must be observed. They depend on the strength and size of the bolts and nuts, the material of the flanges, the PN class, the flange gaskets used and the medium in the hydraulic system.

The tightening torques also depend on the specification of the gasket supplier and must be observed, using a torque wrench.

To determine the right tightening torques, refer to the suppliers' specifications. According to EN 1515-1, the selection of materials for bolts and nuts is also dependent on the PN class, the temperatures, and other operating conditions, such as the type of medium.

Recommendation Use a torque wrench.

Procedure

1. Clean the flanges.
2. Place the gaskets between the flanges.
3. Fit the bolts, washers and nuts and tighten them by hand.
4. Tighten the bolts crosswise in 3 steps as shown below (M = tightening torque):
 - Step 1: 25 % M
 - Step 2: 50 % M
 - Step 3: 100 % M

1 to 8 = order for tightening the bolts
M = tightening torque

Notes:

- Too low or too high tightening torques can cause leakage at the flange connections or even lead to broken flanges
- Observe the following table "Guide values for tightening torques", page 77

5. When the operating temperature is reached, retighten the bolts.

Guide values for
tightening torques

3.1.4 Stem heating element ASZ6.6

Scope of delivery	
1 Stem heating element ASZ6.6	1 screw M4 x 30 mm including nut
	

To fit the stem heating element, stroke actuator and valve must be assembled. The stem heating element is powered separately.

Special notes on mounting

Prior to mounting, check the following:

1. Actuator and Siemens valve are assembled.
2. Observe compatibility and choice of combinations.

Note
Valve lines V..F43/53..
V..F63..

When using a stem heating element and medium temperatures are below -5 °C, the stem sealing gland must be replaced.

In that case, the sealing gland must be ordered also.

DN 15...50: 4 284 8806 0

DN 65...150: 4 679 5629 0

3.1.5 Thermal insulation

Refer to "

3.2 Commissioning and maintenance

3.2.1 Commissioning

The valve may be put into operation only if actuator and valve are correctly assembled.

Note

Ensure that actuator stem and valve stem are rigidly connected in all positions.

Function check

Valve	Throughport A→AB	Bypass B→AB
Valve stem extends	Closes	Opens
Valve stem retracts	Opens	Closes

3.2.2 Maintenance

The valves are maintenance-free.

3.3 Disposal

Do not dispose of the valve as part of domestic waste.

- Special treatment for individual components may be required by law or make ecological sense.
- Comply with all local and currently applicable laws and regulations.

4 Functions and control

4.1 Selection of acting direction and valve characteristic

The valve's characteristic and acting direction (push to open, pull to open, normally open, normally closed) have an impact on the acting direction and valve characteristic selected with the actuator's DIL switches as well as on the required function in the event of a power failure (actuator with or without spring return function).

The objective is the following: As the positioning signal Y increases, the volumetric flow V through the valve shall rise or, in the event of a power failure, the valve shall fully open, V = 100 % (NO = normally open), or fully close, V = 0 % (NC = normally closed), depending on plant requirements.

Actuator pushing		Push to open		Pull to open		
		Direct		Reverse		
 4030Z15	DIL switches	Acting direction	Linear		Equal-percentage	
		Flow characteristic	Linear		Equal-percentage	
	Without spring return function	No power applied	Maintains the position			
 4030Z16	DIL switches	Acting direction	No mechanical stroke inverter required Selection of acting direction via DIL switch			
		Flow characteristic				
	Without spring return function	No power applied				
 4030Z17	DIL switches	Acting direction	Direct		Reverse	
		Flow characteristic	Linear		Equal-percentage	
	With spring return function	No power applied	Closed (NC function) V = 0 %		Open (NO function) V = 100 %	
 4030Z18	DIL switches	Acting direction	Reverse		Direct	
		Flow characteristic	Linear		Equal-percentage	
	With spring return function	No power applied	Fully open (NO function) V = 100 %		Fully closed (NC function) V = 0 %	

4.2 Calibration

Calibration must be performed when valve and actuator are correctly assembled.

4.3 Technical and mechanical design

The illustrations below only show the valves' basic design; constructional features, such as the shape of plugs, may differ.

2-port valves

Note

2-port valves do not become 3-port valves by removing the blank flange!

3-port valves

Depending on the nominal valve size, a guided parabolic, perforated or slot plug is used – rigidly connected to the valve stem.

The seat is pressed into the valve body together with a special sealing compound.

4.3.1 Vales with pressure compensation

The valves VVF42...K, VVF43...K and VVF53...K and VVF63..K are equipped with a pressure-compensated plug. Thereby volume flow rates with same actuators at higher differential pressure can be controlled.

Note

2-port valves do not become 3-port valves by removing the blank flange!

4.3.2 Plug stop

The built-in plug stop ...

- supports secure guidance of the plug in all stroke positions,
- prevents the head of the stem from immersing into the sealing gland, thus avoiding damage to the seal,
- prevents loss of plug as long as no actuator is fitted.

4.3.3 Valve stem, valve neck, coupling

- The diameter of the valve stem is 10 mm with all types of valves
- The same valve stem design ensures compatibility with the actuators

- 1 Valve stem
- 2 Valve neck
- 3 Valve stem coupling
- 4 Valve neck coupling

4.3.4 Converting a 2-port to a 3-port valve

It is not possible to convert a 2-port valve to a 3-port valve.

2-port valves do not become 3-port valves by removing the blank flange!

4.3.5 Converting a 3-port to a 2-port valve

Every type of 3-port valve can be converted to a 2-port valve.

Notes In that case, the type plate is no longer in compliance with the valve's function. Siemens does not supply replacement type plates.

4.3.6 Flange types

Flanges, flange dimensions and flange connections conform to ISO 7005 and EN 1092 respectively.

Valve types

- 2-port valves: VVF..
- 3-port valves: VXF..

Flange type

Type 21 (integral flange) as per ISO 7005 is an integral component of a pressure device.

Type of flange and flange face

Type B
(raised face)
Type B1

The illustration shows the transition from the flange to the valve body of the V..F.. valves (not true to scale, faces only outlined)

Type F
(with recess)

Gaskets

In the case of ISO 7005, the gaskets do not constitute part of the standard – in contrast to EN 1092.

Note

Up to DN 50, PN 25 is also used for PN 16

Up to DN 50, the flange dimensions of pressure classes PN 16 and PN 25 are identical. For this reason, for k_{vs} values $\leq 40 \text{ m}^3/\text{h}$ and nominal sizes $\leq \text{DN } 50$, the valves of the V..F53.. line (PN 25) are listed in place of the valves of the V..F43.. line (PN 16).

Connecting dimensions [mm]
PN 16/PN 25 to DN 50

DN	D Outside diameter of flange	K Diameter of bolt circle	D2 Diameter of bolt holes	Bolts	
				Quantity	Size
10	90	60	14	4	M12
15	95	65	14	4	M12
20	105	75	14	4	M12
25	115	85	14	4	M12

- 1) For certain valve lines and high k_{vs} values, the valve characteristic is optimized for maximum volumetric flow k_{V100}
- 2) For medium temperatures < -5 °C, the stem sealing gland must be replaced. The sealing gland must be ordered separately, stock number 4 284 8806 0 for DN 15...50 and 4 679 5629 0 for DN 65...150
- 3) Valves where $PS \times DN < 1000$ do not require special testing and cannot carry the CE-marking
- 4) The documents can be downloaded from <http://www.siemens.com/bt/download>

8 Addendum

8.1.1 Abbreviations

Abbreviation	Unit	Term	Explanation
c	[kJ/kgK]	Specific heat capacity	See "Specific heat capacity", page 98
DN	-	Nominal size	Characteristic for matching parts of a piping system
F _R	-	Correction factor	Factor for impact of valve's Reynolds number
H	[mm]	Stroke	Travel of valve or actuator stem
H ₀	[m]	Shutoff head	Pump head when medium is supplied. The head generated by a pump when the valve is fully closed
k _v	[m ³ /h]	Nominal flow	Amount of cold water (5...30 °C) passing through the valve at the respective stroke and at a differential pressure of 100 kPa (1 bar)
k _{vr}	[m ³ /h]	-	Smallest volumetric flow that can be controlled, that is, when the valve starts to open (opening step)
k _{vs}	[m ³ /h]	Nominal flow	Nominal flow rate of cold water (5...30 °C) through the fully open valve (H ₁₀₀) at a differential pressure of 100 kPa (1 bar)
m	[kg/h]	Mass flow Steam mass flow	-
PN	-	PN class	Characteristic relating to the combination of mechanical and dimensional properties of a component in a piping system
P _v	-	Valve authority	See "Valve authority P _v ", page 98
Q ₁₀₀	[kW]	Rated capacity	Design capacity of plant
Q _{min}	[kW]		Smallest output of a consumer that can be controlled in modulating mode
r _{p1}	[kJ/kgK]		Specific heat capacity of steam
S _v	-	Rangeability	See "Rangeability S _v ", page 98
V ₁₀₀	[m ³ /h], [l/s]	Volumetric flow	Volume per unit of time through the fully open valve (H ₁₀₀)
ρ	[kg/m ³]	Density	Mass per volume
ν	[mm ² /s], [cSt]	Kinematic viscosity	1 mm ² /s = 1 cSt (centistoke), also refer to 2.7.3.3 Kinematic viscosity ν, page 46
Δp	[kPa]	Differential pressure	Pressure difference between plant sections
Δp _{max}	[kPa]	Max. differential pressure	Maximum permissible differential pressure across the valve's throughport (control path) for the entire positioning range of the motorized valve
Δp _{MV}	[kPa]	-	Differential pressure across the section with variable flow
Δp _s	[kPa]	Closing pressure	Maximum permissible differential pressure at which the motorized valve still closes securely against the pressure
Δp _{v0}	[kPa]	-	Maximum differential pressure across the valve's fully closed throughport (control path)
Δp _{v100}	[kPa]	Differential pressure at nominal flow rate	Differential pressure across the fully open valve and the valve's throughport A – AB at the volumetric flow V ₁₀₀
Δp _{V_R}	[kPa]	-	Differential pressure of flow and return
ΔT	[K]	Temperature spread	Temperature difference of flow and return

8.1.2 Important formulas

Value	Formula	Unit	
Differential pressure Δp_{V100} across the fully open valve	$\Delta p_{V100} = 100 \cdot \left(\frac{\dot{V}_{100}}{k_{Vs}} \right)^2$	[kPa]	
Rangeability S_V	$S_V = \frac{k_{Vs}}{k_{Vr}}$	-	
Valve authority P_V	Header with pressure, variable volumetric flow $P_V = \frac{\Delta p_{V100}}{\Delta p_{VR}}$ <ul style="list-style-type: none"> • Header with pressure, constant volumetric flow • Header with low differential pressure, variable volumetric flow $P_V = \frac{\Delta p_{V100}}{\Delta p_{V100} + \Delta p_{MV}}$	-	
Volumetric flow V_{100}	Water without antifreeze $\dot{V}_{V100} = \frac{Q_{V100}}{1,163 \cdot \Delta T}$	Water with antifreeze $\dot{V}_{V100} = \frac{Q_{V100} \cdot 3600}{c \cdot \rho \cdot \Delta T}$	[m ³ /h]

8.1.3 Valve-related glossary

DIN EN 14597	Standard on temperature controls and temperature limiters for use in heat generating plants. This standard also covers actuating equipment (actuating devices) with safety function for temperature and pressure limitation as per DIN EN 14597
HIT	The HVAC Integrated Tool (HIT) supports sizing and selection of valves for water with antifreeze (www.siemens.com/hit)
Actuating device	Combination of valve and actuator
Rangeability S_V	Characteristic of an actuating device, used to assess the device's controllable range; ratio of the nominal flow rate k_{Vs} to the smallest controllable flow k_{Vr}
Valve authority P_V	Ratio of the differential pressure across the fully open valve (H_{100}) to the differential pressure across the valve plus that of the pipe section with variable volume. To ensure correct control, the valve authority must be a minimum of 0.25
Specific heat capacity	The specific heat capacity is the amount of heat required to heat the mass of 1 kg of a substance by 1 K. It increases as the temperature of the substance rises; in the case of gases, also as the pressure of the substance rises. Therefore, with gases, a distinction is made between c_p , the specific heat at a constant pressure, and c_v , the specific heat at a constant volume

8.1.4 Hydraulics-related glossary

Film temperature	Temperature of the valve surfaces that are in contact with the heat transfer oil at which the oil starts to disintegrate
Cavitation	Due to high speeds of the medium in the narrowest section of the valve, local underpressure occurs. If this pressure drops below the medium's boiling pressure, cavitation occurs (steam bubbles), possibly leading to material removal (abrasion). Also, when cavitation starts, the noise level increases abruptly. Cavitation can be avoided by limiting the pressure differential across the valve as a function of the medium temperature and the prepressure. For more detailed information, refer to "2.12 Cavitation", page 65
Selection of valve characteristic	Certain types of Siemens actuators are equipped with DIL switches for the selection of a linear or an equal-percentage valve characteristic. The objective is to linearize the volumetric flow through the consumer and the valve
Closed circuit	The medium circulates in a closed hydraulic system with no contact to the atmosphere
Open circuit	The circulating medium is in contact with the atmosphere, that is, the hydraulic system is open to atmosphere (e.g. cooling towers with open tanks, or showers). Hence, the system can absorb oxygen from the surrounding air, which can lead to rust; in addition, more attention is to be paid to cavitation; for more information, refer to "2.12 Cavitation", page 65
Control stability	The stability of a closed control loop depends on the degree of difficulty S of the controlled system and the circuit amplification V_0 . For more detailed information, refer to the Siemens brochure "Control technology" (ordering no. 0-91913-en)
Return temperature T_{RL}	Temperature of the medium at which it returns from the consumer to the heat or cooling source
Gravity circulation	The density of a medium depends on its temperature. If a medium is hot in one place and cold in another, it starts to circulate due to different densities
Volumetric flow V	Volume of a medium that passes through an opening for a certain time
Flow temperature T_{VL}	Temperature of a heating or cooling medium at which it leaves its source to enter a hydraulic circuit
Selection of acting direction	Certain types of Siemens actuators are equipped with DIL switches for selection of the operating action of the respective valve (push to open, pull to open, normally open, normally closed). The objective is to drive the valve to the fully open or fully closed position should a power failure occur, depending on plant requirements
Forced control	If forced control is demanded, no consideration is given to any other control command. For example, if there is risk of frost, more heat is supplied to prevent freeze-ups

8.1.5 Media-related glossary

Enthalpy	Amount of energy contained in a thermodynamic system (heat content)
FDA	Food and Drug Administration (USA)
Saturated steam	Boundary between wet and superheated steam; Wet steam: Parts of the gaseous water condensate to become very fine droplets Superheated steam: "Dry" steam without water droplets
Brine	Solution consisting of salt and water
Heat transfer oil/thermal oil	Heat transfer fluid on the basis of mineral oil, synthetic, organic, or on the basis of silicon, uniform or mixed
Water	Chemical compound consisting of oxygen (O) and hydrogen (H). Also refer to VDI 2035 for information on avoiding damage to drinking and domestic hot water plants
Water with antifreeze	The water contains an antifreeze which also inhibits corrosion. For the types of antifreeze used in the trade, also refer to chapter "8.1.7 Overview of antifreeze and brines used in the trade", page 100
Glycol	Glycol is added to water to lower the water's melting point. Examples are ethylene glycol and propylene glycol. Refer to chapter "8.1.7 Overview of antifreeze and brines used in the trade", page 100
Water, deionized	The ions of salts contained in the water have been removed
Water, demineralized	The minerals contained in the water have been removed
Water, super-clean water	Specially treated water; various processes are used to remove dissolved salts and other undesirable substances. It has a high specific resistance and contains no organic substances

8.1.6 Trade names

Trademark	Legal owner
Acvatix	Siemens
Glythermin	BASF
Antifrogen, Protectogen	Clariant
Dowcal	Dow
Zitrec, Freezium	Arteco NV/SA
TYFOCOR, TYFOXIT	Tyforop Chemie GmbH
GLYKOSOL, PEKASOL, PEKASOLar	Glykol & Sole GmbH
Temper	Temper Technology

8.1.7 Overview of antifreeze and brines used in the trade

The list below is not exhaustive. It specifies manufacturer data and is not to be regarded as an official approval for Siemens products in the indicated temperature range. For temperature ranges of individual product lines, see chapter Operating pressure and medium temperature, page 59.

The notes given under "2.13 Medium quality and medium treatment", page 67 must also be observed.

	Supplier	Product number	Basic medium	Permissible limit weight fractions	Temperature range of medium	Usage
Water with antifreeze	BASF www.basf.com	Glythermin® NF	Heat transfer medium on the basis of ethylene glycol and inhibitors	-	-35... 150 °C	No known restriction
		Glythermin® P 44-00	Basis: Propylene glycol plus anticorrosion additives	-	-50... 150 °C	No known restriction
		Glythermin® P 44-92	Basis: Propylene glycol plus anticorrosion additives	-	-50... 150 °C	No known restriction
		Glythermin® P 82-00	Heat transfer medium for solar plants on the basis of glycol and inhibitors	-	-27... 170 °C	No known restriction
		Glystantin FC	Basis Ethylene glycol → Automobile applications, engine test bed	60 %	-40 °C... 120 °C	No known restriction
	Clariant www.antifrogen.de	Antifrogen SOL	Basis: Propylene glycol and glycol with a higher boiling point plus anticorrosion additives. Ready to use, premixed with desalinated water (frost protection -27 °C)	Ready-to-use mixture	-27... 170 °C	No known restriction
		Antifrogen KF	Basis: Potassium formate plus anticorrosion additives	50 %	-50... 20 °C	Restricted - compatibility must be tested
		Antifrogen N	Basis: Monoethylene glycol plus anticorrosion additives	70 %	-35... 150 °C	No known restriction
		Antifrogen L	Basis: Propylene glycol plus anticorrosion additives	100 %	-25... 150 °C	No known restriction
	Dow www.dow.com/heattrans	Dowcal 10	Heat transfer medium on the basis of ethylene glycol and special inhibitor	-	-50... 170 °C	No known restriction
		Dowcal 20	Heat transfer medium on the basis of propylene glycol for higher temperatures than other propylene glycol liquids	-	-45... 160 °C	No known restriction
		Dowcal N	Heat transfer medium on the basis of propylene glycol with little acute toxicity if swallowed; widely used in the food and beverage industry and in other sectors to lower the freezing point	-	-45... 120 °C	No known restriction
	Arteco NV/SA www.zitrec.com/	Zitrec MC	Multipurpose heat transfer medium on the basis of monoethylene glycol, mixed with an adequate amount of water	< 70 %	-55... 120 °C	No known restriction
		Zitrec LC	Multipurpose heat transfer medium on the basis of monopropylene glycol, mixed with an adequate amount of water	< 70 %	-55... 120 °C	No known restriction
		Zitrec FC	Multipurpose heat transfer medium on the basis of monopropylene glycol, mixed with an adequate amount of water; all substances contained in the medium are approved by FDA	< 70 %	-50... 120 °C	No known restriction
		Zitrec S	Multipurpose heat transfer medium without glycol, on the basis of a substance consisting of potassium formate and sodium propionate	Ready-to-use mixture	-55... 120 °C	Restricted - compatibility must be tested
	Tyforop Chemie GmbH www.tyfo.de/index_deutsch.html	TYFOCOR® L	Freezing and anticorrosion agent, safe with regard to health, specifically for keeping food cool and for solar plants, virtually odourless, hygroscopic liquid. It is based on propylene glycol, which poses no hazard to health and which may be used as a coolant or heat-transfer fluid in food processing and water purification applications.	-	-25... 140 °C	Restricted - compatibility, especially with respect to soft solder - individual case must be tested
		TYFOCOR® HTL	Ready-to-use heat transfer medium for solar plants with higher thermal loads, clear, blue-green colored liquid with a faint odour and is based on 1.2-propylene glycol and polyethylene glycol.	-	...170 °C	Restricted - compatibility, especially with respect to soft solder - individual case must be tested
		TYFOCOR® LS	Special, ready-to-use heat transfer medium, evaporating without residue, for solar plants with high thermal loads (vacuum tube collectors); faint odour, based on physiologically unobjectionable propylene glycol, and water.	-	-25... 170 °C	Restricted - compatibility, especially with respect to soft solder - individual case must be tested

Supplier	Product number	Basic medium	Permissible limit weight fractions	Temperature range of medium	Usage
	Tyfocor	Clear, colorless, faint odour liquid, based on ethylene glycol.		-50...140 °C	Restricted - compatibility, especially with respect to soft solder - individual case must be tested
	Tyfocor G-LS	Reversibly evaporable special heat-transfer fluid based on 1.2-propylene glycol, for use in solar thermal systems		...170 °C	Restricted - compatibility, especially with respect to soft solder - individual case must be tested
	TYFO-SPEZIAL	High-quality, powerful brine, specifically for use in earth linked thermal heat pump systems		-10...30 °C	Restricted - copper, brass and bronze material is not resistant, test sealing material in individual case
Glykol & Sole GmbH www.glykolundsole.com/	GLYKOSOL N	Yellowish fluid on the basis of monoethylene glycol for use as a heat transfer medium with highly efficient anticorrosion additives and hardness stabilizers; free from nitrite, amine and phosphate	25...40 %, depending on the application	-50...170 °C	No known restriction
	GLYKOSL WP	Based on Ethandiol 1.2 (ethyleneglycol)	-	-	Check permissibility in individual case
	PEKASOL 2000	Aqueous solution of environmentally safe alkaline earth formate and acetate. PEKASOL 2000 is free of amine, nitrite and phosphate.	-	-60...60 °C	Restricted - compatibility, especially with respect to soft solder and zinc - individual case must be tested
	PEKASOL L	Yellowish fluid on the basis of propylene glycol for use as a heat transfer medium with highly efficient anticorrosion additives and hardness stabilizers; free from nitrite, amine and phosphate	25...40 %, depending on the application	-50...185 °C	No known restriction
	PEKASOLar 100 PEKASOLar 50	PEKASOLar 100 and its dilutions are colorless and odorless liquids on basis of propylene glycol with newly developed additives New installations must be adequately cleaned before filling. Recommended is a 5 % pro KÜHLSOLE PEX 130 solution.	-	-50...150 °C	Restricted - compatibility, especially with respect to soft solder - individual case must be tested
Arteco NV/SA www.zitrec.com/Products_Freezium.htm	Freezium	Salt brine on the basis of potassium formate, specially developed for use in indirect cooling systems and heat pumps. Suitable for a temperature range from -60 to 95 °C	24 ..50 %	-60...35 °C	Restricted - individual case must be tested

Supplier	Product number	Basic medium	Permissible limit weight fractions	Temperature range of medium	Usage
Tyforop Chemie GmbH www.tyfo.de/index_deutsch.html	TYFOXIT®F15-F50	High-performance coolant on the basis of potassium formate (safe with regard to food). Available as a ready-to-use mixture in 6 variants (F15 - F50), cooling limits from -15 to -60 °C. Excellent flow properties at low temperatures, due to low viscosity	-	-60...100 °C	Restricted permissibility, more precise evaluations at 20...80 °C necessary (test soft solder in individual case)
	TYFOXIT® 1.25	High-performance coolant on the basis of potassium acetate (safe with regard to food). Supplied as a concentrate or ready-to-fill mixture and suited for use at temperatures down to -55 °C	-	-55...100 °C	Restricted permissibility, more precise evaluations at 20...80 °C necessary (test soft solder in individual case)
Temper Technology www.temper.se/Temper_(eng)/Temper/Download_information/Temper_DXN-2251.aspx	Temper	Synthetic and homogenized, glycol-free solutions on the basis of salts; suitable for temperatures from -10 to -50 °C; colorless to slightly yellowish; contain no amines or nitrites, but additives to support protection against corrosion and to improve lubrication	Ready-to-use mixtures	-55...180 °C	Restricted ²⁾ - check compatibility, especially with respect to fiber gasket, PTFE (Teflon), FPM (Viton), soft solder unsuitable Cast iron at higher temperatures unsuitable Non-ferrous metal suited to a limited extent, must be tested in individual case

¹⁾ Supplier's Usage Instructions must be observed.

²⁾ Restricted usage with regard to concentration or temperature
